Re: Graduate product manager

Across five-plus years in FMCG commercial roles at AB InBev and Pernod Ricard, I found that I kept doing the same thing regardless of my job title. I looked past my remit for the problem that actually mattered, and then built something to solve it, whether that was a churn prediction model, a self-organising hitlist, or the launch of DraftVision, the industry's first operations platform. I took this from a problem no one owned to a shipped product. With no prior app experience, I scoped it to an MVP, prioritised ruthlessly against what would actually move the business, and coordinated designers and engineers to get it live rather than letting it sprawl into the flashy version that would never ship. Investigate, build, execute, iterate – before I had those words for it that was already the work I gravitated to.

That's exactly why Bending Spoons model pulls at me. I don't want to diagnose a problem and hand it off, I want to own a product, operate it for the long term, and keep improving it with the business consequences sitting on my own desk. Talent dense teams and AI woven into how the work gets done is the environment I've been trying to build around myself. My background is in operationalising insight, from churn models to route optimisation, and most recently in evaluating AI driven businesses.

I reason from first principles and frame a problem before attacking it, the discipline an MBA sharpened on top of an instinct I already had. I hold my own bar high and raise it, and I back the best idea in the room over my own. I know the bar here is unusually high and the tests are hard. That's the appeal, not the deterrent.

I'd be glad to show you what I can do.

Thank you for your consideration.

Sincerely,

Sumant Duggal
